Simple example for text-decoration

The "text-decoration"-property describes decorations that are added to the text of an element. If the property is specified for a block-level element, it should affect all inline-level descendants of the element . If it is specified for (or affects) an inline-level element, it affects all boxes generated by the element.

Example: underline

Block level example: underline

```
<fo:inline text-decoration="underline">underline</fo:inline>
```

This is simple test of the text-decoration underline.

This is simple test with a bigger font-size.

```
This is simple test with a monospaced font.
```

The following text decorations are defined in the CR:

- none
- underline
- overline
- ~~line-through~~
- blink
- no-underline
- no-overline
- no-line-through
- no-blink

Combination of property values should also be possible.

```
<fo:inline text-decoration="underline overline"> Combination</
fo:inline>
```

And now more than a word ...

This is a whole block with the property text-decoration="underline". Some more Text to get at least two lines.

This is a whole block with the property text-decoration="underline" and an inline with text-decoration="overline" bigger font-size.

```
This is simple test with a monospaced font.
```

What about underlining of whitespace only ?
